

## WERA for Port of Rotterdam

Middle of 2015, two WERA HF radar systems will be installed in the Maasmond area, South Holland, to improve and give more reliable navigation information for vessel traffic in direction of the Port of Rotterdam.

The systems will permanently monitor the coastal area in front of the harbour entrance and the HF radar data will be assimilated into 3D ocean current models to improve prediction. This information will be made available to the pilots of incoming and outgoing shipping.

The EU tender "HF-Radarsystem Maasmond" ended October 16, 2014, has been awarded to Helzel Messtechnik and the contract with Rijkswaterstaat has been signed December 10, 2015.

Claudia de Andrade, Director of Development and Services RWS CIV and Matthias Kniephoff at the contract signature in December 2014 in Delft.
